2021 Cloud IoT Services Assignment #3

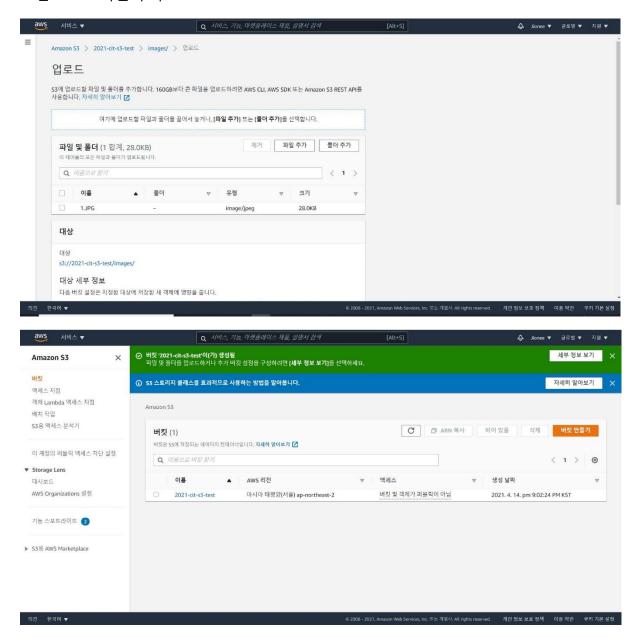

[이름: 유지원 / 학번: 201812627]

Task #1: Create Applications for AWS S3 Service

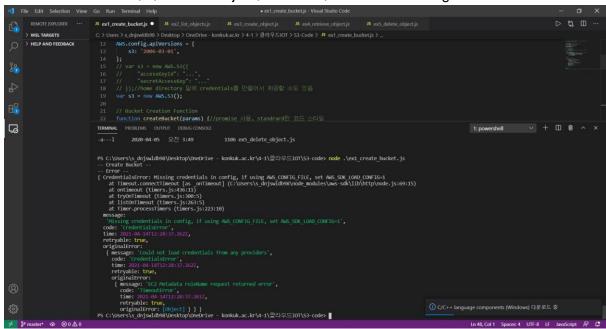

- 1-1) Create AWS S3 Bucket and Object by AWS Web Console
- Create a S3 Bucket
- > S3 > 버킷 만들기 클릭 > 이름 작성, Region 설정 후 S3 Bucket 을 생성한다.

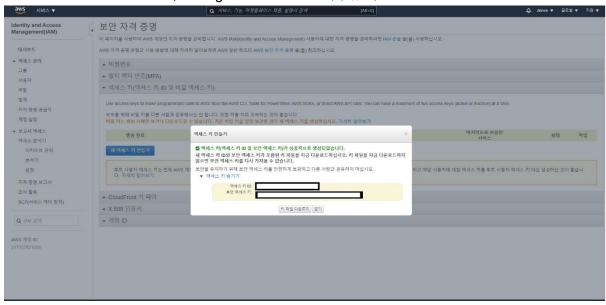

- Create a S3 Object in the bucket by uploading a file from your notebook through AWS Console
- > 업로드 > 파일 추가

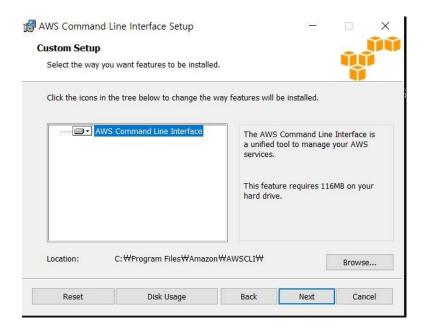

- 1-2) Create a Node.JS Application with AWS SDK to create a S3 object in the bucket
- Credentials
- * credential 을 설정하지 않고 node.js 파일 실행 시 credential missing error 발생 >>

>> Credential 을 발급받고, Configuration 설정을 해주었다.

>> 윈도우에서 aws 명령어를 사용하기 위해 AWS Command Line interface 설치

>> aws configure -profile user2 를 이용해서 credential 설정

```
C:#Users\s_dnjswldb98>aws configure --profile user2
AWS Access Key ID [None]:
AWS Secret Access Key [None]:
Default region name [None]: ap-northeast-2
Default output format [None]: text
C:#Users\s_dnjswldb98>
```

Var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'}); AWS.config.credentials = credentials;

```
| Section | Decicion | Decicion | Section | Se
```

- Create a S3 object in the bucket by uploading a file from notebook

```
#1. create_bucket.js
//버킷 만들기
var AWS = require('aws-sdk'); //object 만들어짐
var fs = require('fs'); //file 시스템
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var s3 = new AWS.S3();
// Bucket Creation Function
function createBucket(params) {//promise 사용, standrard 한 코드 스타일
    return new Promise(function (resolve, reject) {
        s3.createBucket(params, function (err, data) {
           if (err) reject(err); // an error occurred
```

```
else resolve(data);
        });
    });
var test = async function () {
    try {
        console.log("Region: ", AWS.config);
        console.log("env, ", process.env.AWS_CONFIG)
        console.log('-- Create Bucket --');
        // Bucket Creation Request Parameters
        var cb_params = {
            Bucket: "cws-lab-s3-v2", //만들 버킷 이름
        };
        var res1 = await createBucket(cb_params);
        console.log(res1);
    } catch (err) {
        console.log('-- Error --');
        console.log(err);
// run the test
test();
```

```
#2. list object.js
var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var s3 = new AWS.S3();
function listObjects(params) {
    return new Promise(function (resolve, reject) {
        s3.listObjects(params, function (err, data) {
            if (err) reject(err);
            else resolve(data);
        });
    });
```

```
var test = async function () {
   try {
      var cb_params = {
          Bucket: "cws-lab-s3-v2",
      };
      console.log('-- List the Objects in the Bucket --');
      var res4 = await listObjects(cb_params);
      console.log(res4);
   } catch (err) {
      console.log('-- Error --');
      console.log(err);
   }
}
// run the test
test();
```

```
#3. create_object.js
var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var s3 = new AWS.S3();
function createObject(params) {
    return new Promise(function (resolve, reject) {
        s3.upload(params, function (err, data) { //local 에서 S3object 로 업로
            if (err) reject(err);
            else resolve(data);
       })
    });
var test = async function () {
    try {
        // 1st Object
        const co params1 = {
            Bucket: "cws-lab-s3-v2",
            Key: 'testImg.jpg', //만들 Object ID
```

```
Body: fs.createReadStream("./testImg.jpg") //현재 디렉토리 여기에 있는 애를 //크니까 stream으로 읽어서 위 ID로 object 생성
    };
    var res2 = await createObject(co_params1);
    console.log(res2);

} catch (err) {
    console.log('-- Error --');
    console.log(err);
  }
}
// run the test
test();
```

```
#4. retrieve_object.js
var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var s3 = new AWS.S3();
function retrieveObject(params) {
    return new Promise(function (resolve, reject) {
        s3.getObject(params, function (err, data) {
            if (err) reject(err);
            else resolve(data);
        });
    });
var test = async function () {
    try {
        console.log('-- Retrieve an Object from the Bucket --');
        // Object Retrieval Request Parameters
        const ro params = {
            Bucket: "cws-lab-s3-v2",
            Key: 'testImg.jpg', //O| object
        };
        var data = await retrieveObject(ro_params);
        // write the obejct to a local file
```

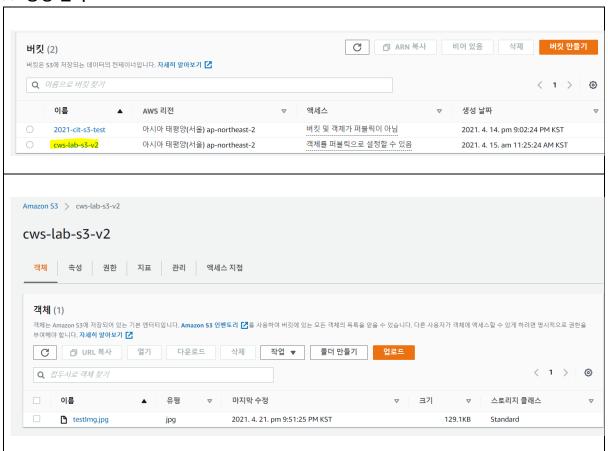

```
fs.writeFile('./data.jpg', data.Body, (e, d) => {
        if (e) console.log(e);
        else console.log('Image is read and written to data.jpg !'); //s
3 에 있는 파일을 읽어서 local의 data.jpg 에 저장하기
     });
     } catch (err) {
        console.log('-- Error --');
        console.log(err);
     }
}
// run the test
test();
```

```
#5. delete object.js
var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var s3 = new AWS.S3();
// Object Deletion
function deleteObject(params) {
    return new Promise(function(resolve, reject) {
        s3.deleteObject(params, function (err, data) {
            if(err) reject(err);
            else resolve(data);
        });
    });
var test = async function () {
    try {
        console.log('-- Delete an Object from the Bucket --');
        const do params = {
            Bucket: "cws-lab-s3-v2",
            Key: 'testImg.jpg',
        };
        var res6 = await deleteObject(do_params);
        console.log(res6);
    } catch (err) {
```

```
console.log('-- Error --');
  console.log(err);
}

// run the test
test();
```

>> 생성 결과

Task #2 : Create an AWS Lambda function to create a S3 object

2-1) index.js 작성해서 압축 후 S3 에 올리기

- 앞서 작성하였던 index.js 와 node_modules, credentials, 그리고 package-lock.json 까지 압축한 후 createDeploymentPackage.js 를 실행시켜 S3 스토리지에 압축 파일을 저장한다.

createDeploymentPackage.js

```
var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var s3 = new AWS.S3();
var createDeploymentPackage = async function (dp_params){
    function createBucket(bucket_name){
        var cb_params = {
            Bucket: bucket_name,
        };
        return new Promise(function(resolve, reject){
            s3.createBucket(cb_params,function(err,data){
                if(err) reject(err); //an error occurred
                else resolve(data);
            });
        });
    function createObject(bucket_name,zipfile){
        const co params = {
            Bucket: bucket name,
            Key:zipfile,
            Body:fs.createReadStream("./"+zipfile),
        };
        return new Promise(function(resolve, reject){
            s3.upload(co_params,function(err,data){
                if(err) reject(err); //an error occurred
                else resolve(data);
            })
        })
```

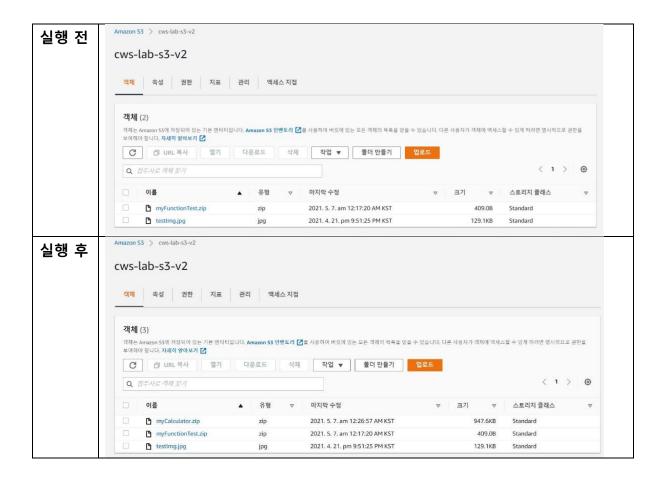

```
if(dp_params.newBucketFlag){
        console.log('-- Create Bucket --');
        var res = await createBucket(dp_params.bucket);
        console.log(res)
    }
    console.log('-- Create Object --');
    var res = await createObject(dp_params.bucket,dp_params.zipfile);
    console.log(res);
    }catch(err) {console.log(err)}
}

var dp_params = {
    bucket :'cws-lab-s3-v2',
    newBucketFlag : false,
    zipfile : 'myCalculator.zip'
};
createDeploymentPackage(dp_params)
```

- myCalculator.zip

결과

실행 후 S3 스토리지 내부에 myCalculator.zip 파일이 생성되었음을 볼 수 있다.

2-2) Create an AWS Lambda function from the S3 object

- LambdaExecution 을 위한 iam role 을 생성하여 createLambdaFunction.js 를 작성한 후 실행시킨다. 그 결과 s3 에 저장해 놓은 zip 파일을 이용한 lambda function 이 생성된다.

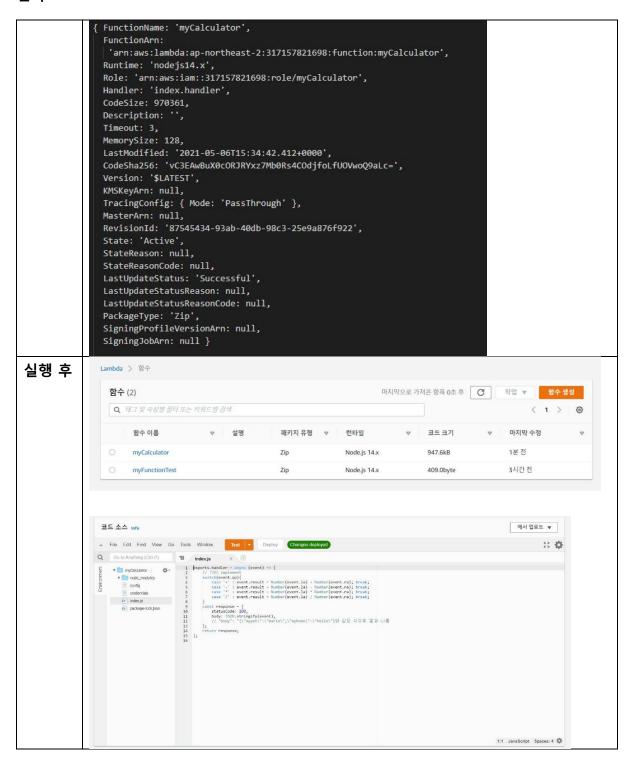

```
createLambdaFunction.js

var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var lambda = new AWS.Lambda();

var params = {
```

- iam role 생성

실행 후 S3 에 저장해 놓았던 myCalculator.zip 로 lambda function 이 만들어 졌음을 볼 수 있다.

Task #3: Create a Node.JS application to invoke the AWS Lambda function in Task#2

- lambda function 을 실행시키는 invokeLamdaFunction.js 를 작성 후 실행시킨다.

```
invokeLamdaFunction.js
var AWS = require('aws-sdk');
var fs = require('fs');
var credentials = new AWS.SharedIniFileCredentials({profile: 'user2'});
AWS.config.credentials = credentials;
AWS.config.region = 'ap-northeast-2';
AWS.config.apiVersions = {
    s3: '2006-03-01',
};
var lambda = new AWS.Lambda();
const exp = {"op":"+", "la":123, "ra":456};
var params = {
    FunctionName : "myCalculator",
    InvocationType : "RequestResponse",
    Payload : JSON.stringify(exp)
};
lambda.invoke(params, function(err, data){
    if(err) console.log(err);
    else console.log(JSON.parse(data.Payload));
```

결과

실행 후 넣은 input(param)에 따라 결과가 다르게 나오는 것을 확인할 수 있다.
